

Upgrade Kits

Improve efficiency

JBT Food & Dairy Systems is globally providing high quality filling systems. These systems are known for their reliability and durability. The uptime of JBT systems will provide our customers the competitive advantage over their competitors. It is our goal to improve this advantage in any way we can. Therefore we are looking for ways that result in a higher productivity performance.

Switch before it's empty

When the foil input is empty, the machine will stop and a new role needs to be placed to create the foil caps. This is resulting in loss of productivity.

The current cap press can be equipped with various options, to facilitate a faster and more reliable replacement of an empty reel.

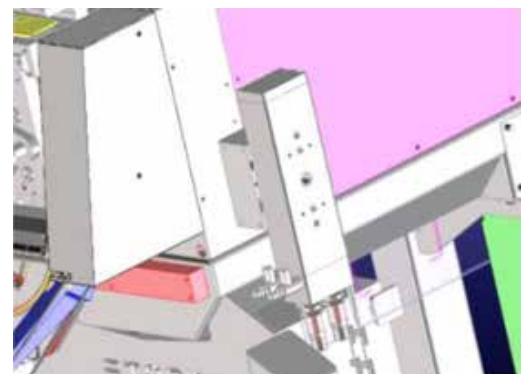

- A second reel unit can be installed, so after replacement, a new reel can be installed on the machine without holding production.
- A splice table can be fitted, along with the second reel, for easy and fast preparation of the splice (joint) between the tail of the old reel, and the start of the new reel.
- An automatic splice feed system can be installed. After preparing a splice (or in case of a splice already present in a reel), the splice will be detected by the sensor, and automatically fed through the press. The manual action of pulling the splice through the press is not necessary anymore.

What will be done?

Depending on the currently installed options on the machine: a second reel, a splice table and an automatic splice feed system will be installed. This system will be installed and commissioned on site

Detail view of proposed Splice Feed Unit adopting Pneumatic Actuator.
