

## Upgrade Kits

### From Indicator to Transmitter

#### General information

JBT SF&DS is globally providing high quality filling systems. These systems are known for their reliability and durability. The uptime of JBT SF&DS systems will provide our customers the competitive advantage over their competitors. It is our goal to improve this advantage in any way we can. Therefore we are always solving issues that result in loss of product, or loss of productivity.

#### Did I miss something?

The filling machine is designed in the most cost effective matter. Therefore any manual set point in the field is monitored with an indicator in the field. These indicators are not connected to the software and cannot be monitored. If in that area problems occur, you need to physically check the values on these indicators to find a root cause. If, for example, a steam filter contaminates, the heating period gradually starts increasing, lowering your OEE without a hard indicator.

Replacing these indicators by transmitters with a display, it can be connected to the software. That enables the HMI or IOT solution connected to the inputs to locate issues. This can even happen before the operator notices something is not correct.

#### Low impact on installation

Installation of the transmitters can be implemented in phases by the customer or a JBT SF&DS representative. The implementation of alarms into the software can be done remotely.

#### Improve performance

By ordering this retrofit, you can:

- Improve your OEE, you didn't know you were losing!
- Save hours of downtime needed for local and remote fault finding
- Be able to check your stock for parts, before you urgently need the part.

Please contact your JBT Customer Care manager for more information.
